

Cintia Losada

Frontend Developer (React / Next.js) — Fullstack

La Plata, Buenos Aires, Argentina · Open to remote · cinlodev@gmail.com

[Portfolio](#) | [GitHub](#) | [LinkedIn](#)

Professional Summary

Frontend developer focused on React, Next.js and Vue, with a fullstack foundation (Node, PHP/Laravel, PostgreSQL). I combine experience building products in real-world settings with a founder's mindset: I designed, built and shipped two SaaS products of my own (CinloLabs and AIDía) end to end. Strong focus on user experience, performance and maintainable code.

Own Products — Founder

CinloLabs — SaaS for dental lab management — *labs.cinlodev.com* · In production, with first client in testing phase

- Designed and built end to end a SaaS platform to digitize the operations of dental mechanics labs (Next.js, React, Tailwind CSS, Supabase).
- Designed a multi-tenant architecture with strict separation between platform (super-admin) and clients, boundaries enforced automatically in CI, RBAC and audit logs.
- Currently expanding the product to onboard dentists as a second user segment, broadening the target market beyond labs.

AIDía — shared expense management — *aldia.cinlodev.com* · In production

- Built a SaaS app to organize group and personal expenses: multiple groups, payment history and receipt uploads (Next.js, React, Tailwind CSS, Supabase).
- Designed the entire product — from the value proposition and user flow to the technical implementation — and shipped it to production independently.

Experience

The following roles are part-time.

FullStack Developer — Campus Mariana Casella | Feb 2026 – present (part-time)

- Corrective and evolutive maintenance of the platform: bug fixing and continuous improvements on production features (Vue + PHP/Laravel backend).
- Took part, as a team, in the full migration of the design system to a dark theme, covering both the student platform and the admin panel.
- Built the new "challenge session" feature for students.
- Contributed to the platform's B2B model: technical implementation of the white-label solution that lets other companies use their own sections and create and sell their own courses.
- As part of a 3-developer team, implemented the integration with the Anthropic API (HTTP client, error handling and usage metrics) for an AI-hint system inside the exercise workspace.
- Built the catalog of "packs" for an internal virtual currency, 100% configurable from the admin panel with no deploy required, and its integration with the existing payment checkout (automatic OCR approval).
- Implemented the "AI hint" endpoint with rate limiting and insufficient-balance handling.
- Work with PostgreSQL (Neon) for data validation and integration; task management via GitHub Issues/Projects; local environments with Docker.

Frontend Developer — Freelance | 2024 – present (part-time)

- Built websites and landing pages for individual clients (direct contacts/referrals), from interface design through production deployment.
- Mobile-first responsive design with a focus on performance and load speed.
- Migration and modernization of existing projects to Next.js.

Other Projects

IMS Platform — team collaborative project (early stage, currently restructuring scope): frontend with Next.js, React 19, TypeScript, Zustand, React Query, React Hook Form + Zod, Radix UI/shadcn and testing with Vitest.

Vault — Developer Command Manager: tool to centralize and organize frequently used development commands (Next.js, React, Tailwind CSS).

Email Testing Platform: isolated Docker-based environment for testing and previewing emails (Next.js, React).

Technical Stack

Frontend: React · Next.js · Vue · JavaScript · TypeScript · Tailwind CSS · Zustand · React Query · Radix UI/shadcn

Backend: Node.js · Express · PHP · Laravel · Prisma

Databases: PostgreSQL · Supabase · MongoDB

Tools: Git · GitHub · Docker · ClickUp · Vitest

Languages

Spanish — Native | English — Technical level (reading and documentation), currently working toward conversational fluency
